Art Unit: 2619

DETAILED ACTION

Applicant's Amendment filed 1/8/2008 is acknowledged.

Claims 1, 9, 12, 13, 16, and 19 have been amended.

Previous objections to claim 12 and the drawings and rejection of claims 13 and

19 under 35 USC 112, 2nd paragraph are withdrawn in light of the amendments.

Claims 20-25 have been added.

Claims 1-25 remain pending.

Claim Objections

1. Claim 15 and 18 is objected to under 37 CFR 1.75(c), as being of improper dependent form for failing to further limit the subject matter of a previous claim.

Applicant is required to cancel the claim(s), or amend the claim(s) to place the claim(s) in proper dependent form, or rewrite the claim(s) in independent form. Claims 15 and 18, which depend from claims 12 and 16, respectively, recite the same limitation as in claims 12 and 16: packeting time is greater than transmission time.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Art Unit: 2619

3. Claims 1-11, 20, and 22-25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Robins et al. (US006430184B1), hereafter Robins, in view of Hellwig et al. (US007020149B1), hereafter Hellwig.

Regarding Claims 1-6, 9, 20, and 23-25,

Robins discloses a system for communicating data packet flows, including Asynchronous Transfer Mode (ATM; Abstract; Col. 1, line 27; <u>claim 1,9</u> - system for processing and transmitting packets of asynchronous data).

Referring to Figs. 1-3, Robins discloses Queue Manager (QM) 30 for managing the packeting and storing of data packets in a plurality of buffers 35/36, where data packets are made up of a plurality of data cells (QM managing the packeting of multiple packets of multiple flows constitutes a plurality of packeting modules; Col. 5, lines 42-51; Col. 6, lines 5 and 25-29; <u>claim 1</u> - a plurality of packeting modules configured to packet asynchronous data; <u>claim 3</u> - a battery connected to said plurality of packeting modules, said at least one battery being configured to store said asynchronous data; <u>claim 9</u> - means for packeting asynchronous data in a packeting module).

Robins further discloses Forwarding Engine (FE) 40 provides instructions to the QM for packeting of flows based upon received packet headers. Processed data is output to Quad PHY 2 (Fig. 1, 73) in an order based upon the instructions from FE (FE together with Quad PHY 2 is considered to be the claimed "message composition module; Col. 7, lines 8-13; <u>claim 1</u> - a message composition module connected to said plurality of packeting modules; <u>claim 4</u> - message composition module is configured to

receive a plurality of packets from said plurality of packeting modules; claim 5 message composition module is configured to receive said plurality of packets one after another in a predetermined order; claim 20 – message composition module recovers packets of async data created by the plurality of packeting modules one after the other in predefined order).

Page 4

Robins discloses cells associated with the same circuit ID are reorganized by link-lists into packets, where Robins also discloses a "cut-through" mode of operation in which the FE instructs packeting of cells to be stopped and the data that has been processed is transmitted before a complete packet of cells is processed, such that portions of a packet may be transmitted while other portions are still being received (Col. 17, lines 25-45; Col 16, lines 17-64; claim 1,2 - each packeting module is configured to stop packeting asynchronous data even if packeting is not completed in response to said request and to send to said message composition module a packet of asynchronous data formed prior to receiving said request; claim 9 - means for stopping/interrupting said means for packeting in response to said request; claim 9 means for transmitting a plurality of packets, even if packet is not completed, each packet of said plurality being formed by said means for packeting prior to an interruption by said means for interrupting; claim 6,9 - composing a message comprising said plurality of packets; claim 24 – means for interrupting interrupts said packeting as soon as the packeting module receives the request from the message composition module; claim 24 - means for transmitting transmits an incomplete data packet composed at time of said interrupting to the message composition module after packeting is interrupted).

Robins does not explicitly disclose FE 40 (message composition module) requests a packet from QM 30 (packeting module) when it needs a packet.

However, Hellwig discloses a method for operating a switching system for data packets (Title) in which, as soon as an access controller MAC 12 signals its availability to the queue manager 42 by means of a message 3 (request), the queue manager requests a packet from the memory management unit in order to compose messages of packets (Fig. 1; Col. 5, lines 4-52; claim 1,2 - message composition module is configured to compose a message and send a request for a packet to each packeting module of said plurality of packeting modules when it needs a packet; claim 9 - means for receiving a request from a message composition module when it needs a packet; claim 23 – means for transmitting transmits said packet as soon as the message composition module requests said packet; claim 24 – means for starting a next packeting operation composing a next data packet as soon as the incomplete packet is transmitted; claim 25 – wherein the message composition module needs said packet after the message composition module has transmitted a previous data packet and is ready to start packeting data again).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Robins by enabling FE 40 to request a packet to be processed when it needs a packet, as shown by Hellwig, ensuring that the processing of the FE is always being utilized while composing different messages of packets to be output.

Art Unit: 2619

- Regarding Claims 7, 8, 10, and 11,

Robins discloses a system for communicating data packet flows that meets all limitations of the parent claims.

Robins discloses that packets that have been processed are output to Quad PHY 2 (Fig. 1, 73) in the appropriate LAN/WAN protocol format for the transmission line (Col. 1, lines 23-26; Col. 5, lines 60-65; <u>claim 7,10</u> - formatting module connected to said message composition module and configured to format said message; <u>claim 8,11</u> – output module configured to transmit said message on a transmission line).

- Regarding Claim 22,

Robins discloses a system for communicating data packet flows that meets all limitations of the parent claims.

Robins discloses QM 30 is implemented to rapidly execute the placing of data on appropriate queues and apply queue policies as directed by FE 40 (Col. 6, lines 25-30; <u>claim 22</u> – packeting module is configured to sort and enhance data).

- 4. Claims 12 and 14-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Robins and Hellwig as applied to claims 1-11 above, and further in view of Kato et al. (US005544336A), hereafter Kato.
 - Regarding Claims 12, 14-16, and 18,

Robins discloses a system for communicating data packet flows, including Asynchronous Transfer Mode (ATM; Abstract; Col. 1, line 27; <u>claim 16</u> - system for processing and transmitting packets of asynchronous data).

Page 7

Referring to Figs. 1-3, Robins discloses Queue Manager (QM) 30 for managing the packeting and storing of data packets in a plurality of buffers 35/36, where data packets are made up of a plurality of data cells (QM managing the packeting of multiple packets of multiple flows constitutes a plurality of packeting modules; Col. 5, lines 42-51; Col. 6, lines 5 and 25-29; <u>claim 16</u> - means for packeting asynchronous data during a packeting time).

Robins further discloses FE 40 (message composition module) that provides instructions (request/message) to the QM for packeting and output of flows to Quad PHY 2 based upon received headers (FE together with Quad PHY 2 is considered to be the claimed "message composition module; Col. 7, lines 8-13). Robins discloses cells associated with the same circuit ID are reorganized by link-lists into packets, where Robins also discloses a "cut-through" mode of operation in which the FE instructs packeting of cells to be stopped and the data that has been processed is transmitted before a complete packet of cells is processed, such that portions of a packet may be transmitted while other portions are still being received (Col. 17, lines 25-45; Col 16, lines 17-64; claim 16 - means for stopping/interrupting said means for packeting in response to said message; claim 16 - composing a message comprising said plurality of packets; claim 16 - means for transmitting said message during a message transmitting time, even if packet is not completed).

Page 8

Robins does not explicitly disclose FE 40 (message composition module) requests a packet from QM 30 (packeting module) when it needs a packet.

However, Hellwig discloses a method for operating a switching system for data packets (Title) in which, as soon as an access controller MAC 12 signals its availability to the queue manager 42 by means of a message 3 (request), the queue manager requests a packet from the memory management unit in order to compose messages of packets (Fig. 1; Col. 5, lines 4-52; <u>claim 16</u> – means for requesting a packet when a message composition module needs a packet).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Robins by enabling FE 40 to request a packet to be processed when it needs a packet, as shown by Hellwig, ensuring that the processing of the FE is always being utilized while composing different messages of packets to be output.

Robins discloses that cut-through mode causes packeting to be ended and data is passed to Quad PHY 2 (Fig. 1, 73), such that portions of a packet may be transmitted while other portions are still being received (Col. 17, lines 42-45). However, Robins does not explicitly disclose the time for packeting (TP) approaches the total time (TT) for transmitting of data by minimizing the time for transmitting.

Kato discloses that a parallel processing system can reduce overhead caused by the data transmission in a system. When multiple processing units operate synchronously, data can be transmitted while other data is received and processed

(Abstract; <u>claim 12,15,16,18</u> – packeting of said asynchronous data is performed during a packeting time greater than half of a total time for packeting said asynchronous data and for transmitting said message; <u>claim 14</u> - packeting time is equal to a cycle time for a transmission line over which said formatted message is transmitted).

It would have been obvious to one of ordinary skill in the art at the time of the invention to maximize the transmission cycle in Robins such that the time for packeting approaches the total time for transmitting of data. This is accomplished by minimizing the time for transmitting, as shown by Kato, since data can be transmitted at the same time as other data is being received and processed, so that the transmission time is counted as zero.

- Regarding Claims 17,

Robins discloses a system for communicating data packet flows that meets all limitations of the parent claims.

Robins discloses that packets that have been processed are output to Quad PHY 2 (Fig. 1, 73) in the appropriate LAN/WAN protocol format for the transmission line (Col. 1, lines 23-26; Col. 5, lines 60-65; <u>claim 17</u> - formatting module connected to said message composition module and configured to format said message; <u>claim 17</u> – output module configured to transmit said message on a transmission line).

Art Unit: 2619

5. Claim 21 is rejected under 35 U.S.C. 103(a) as being unpatentable over Robins and Hellwig as applied to claim 1 above, and further in view of Halliday et al. (US20020083345A1), hereafter Halliday.

- Regarding Claim 21,

Robins discloses a system for communicating data packet flows that meets all limitations of the parent claims.

Robins does not explicitly disclose a message including data equal to or less than 11 and including one wrapping.

Halliday discloses communication of a message including 3 packets in a message having one header (wrapping; Fig. 5 and 10; <u>claim 21</u> – message includes a number of data in said packet of async data equal to or less than 11, said message includes one wrapping).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Robins by including multiple data packets in a message using a single header, as shown by Halliday, thereby conserving the bandwidth required to send each data packet with its own header.

Art Unit: 2619

6. Claims 13 and 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Robins, Hellwig and Kato as applied to claims 12 and 18 above, and further in view of Fiorini (US005740173A).

- Regarding Claims 13 and 19,

Robins discloses a system for communicating data packet flows that meets all limitations of the parent claims.

As shown above in the rejection of claims 12 and 18, it would have been obvious to one of ordinary skill in the art at the time of the invention to maximize the transmission cycle in Robins such that the time for packeting approaches the total time for transmitting of data. This is accomplished by minimizing the time for transmitting, as shown by Kato, since data can be transmitted at the same time as other data is being received and processed, so that the transmission time is counted as zero (claim 13,19 - time for said transmitting said message is negligible compared to said packeting time within total time).

Robins does not explicitly disclose the total time being less than 100 ms (Col. 1, lines 25-27). However, Robins discloses support for ATM data, which has a packeting and transmit time of less than 100 ms as shown by Fiorini (Col. 17, lines 32-35; <u>claim</u> 13,19 - total time of less than 100 ms).

It would have been obvious to one of ordinary skill in the art at the time of the invention to enable packeting and transmitting time to be less than 100 ms in Robins, as shown by Fiorini, in order to support the ATM data communication disclosed by Robins.

Art Unit: 2619

Response to Arguments

7. Applicant's arguments filed 1/8/2008 regarding the objection of claims 15 and 18 have been fully considered but they are not persuasive.

- In the Remarks on pg. 9 of the Amendment, Applicant contends that claims
 15 and 18 do not recite the same limitation as in claims 12 and 16.
- The Examiner respectfully disagrees. While claims 15 and 18 do not recite the same explicit limitations as in claims 12 and 16, they do not further limit the claims from which they depend. Claim 15 recites "packeting time is more than a time for transmitting said formatted message. However, claim 12, from which claim 15 depends, states that packeting time is greater than half of a total time for packeting and transmitting, thus defining packeting time to be greater than transmitting time. Therefore, the limitation of claim 15 does not further limit the limitations presented in claim 12. Claims 16 and 18 also recite these contextually equivalent limitations, therefore the objection to claim 18 is also maintained for failure to further limit its parent claim.
- 8. Applicant's arguments with respect to claims 1-25 have been considered but are moot in view of the new ground(s) of rejection.

Art Unit: 2619

Conclusion

9. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Gregory B. Sefcheck whose telephone number is 571-272-3098. The examiner can normally be reached on Monday-Friday, 8:00am-4:30pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wing Chan can be reached on 571-272-7493. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
